

COVID-19 CASES IN CAMBRIDGESHIRE

DASHBOARD AT 3 APRIL 2020

Cambridgeshire **reported** 6 new cases and 172 cumulative cases on 3 April.

The **actual** number of cases was significantly higher reported because:

- 1) Only hospital patients with laboratory confirmation are reported.
- 2) Up to 30% of people will be asymptomatic (ie. not show any symptoms).
- 3) Others will have very mild symptoms.
- 4) People will carry the virus for 5 days on average before displaying any symptoms.

22 March 2020 report by Centre for Mathematical Modelling of Infectious Diseases estimates that only 5.4% of symptomatic COVID-19 cases are reported in the UK. If we multiply the reported cases by 18, this will give an estimate of actual cases.

Cambridgeshire remains relatively low with 476 estimated cumulative cases per 100,000. If we strictly follow the government instructions, we can hopefully slow down the spread of the virus.
