

COVID-19 CASES IN CAMBRIDGESHIRE

DASHBOARD AT 6 APRIL 2020

Cambridgeshire **reported** 10 new cases and 222 cumulative cases on 6 April.

The **actual** number of cases was significantly higher than reported because:

- 1) Only hospital patients with laboratory confirmation are reported.
- 2) Up to 30% of people will be asymptomatic (ie. not show any symptoms).
- 3) Others will have symptoms, but not serious enough for hospital admission.
- 4) People will carry the virus for 5 days on average before displaying any symptoms.

The 22 March 2020 report by the Centre for Mathematical Modelling of Infectious Diseases estimates that only 5.4% of symptomatic COVID-19 cases are reported in the UK. If we multiply the reported cases by 18, this will give an estimate of actual cases.

Cambridgeshire remains relatively low with 614 estimated cumulative cases per 100,000. If we strictly follow the government instructions, we can hopefully slow down the spread of the virus.
